Exercise 1:

A CSE101 student types the following:

```
S='25 Main Street Kingston';
```

Realizing that the address has the wrong number, the student types

```
S(1) = 33;
disp(S);
```

The output of the disp statement is

```
!5 Main Street Kingston
```

Explain what the student did wrong and why the ! is posted.

Exercise 2:

Describe two activities performed by the Central Processing Unit (CPU) of Von Neumann's computer architecture

Exercise 3:

The following function aims to find the largest value in the diagonal of a square matrix. You are given the definition of the function and the description of its inputs and outputs. Complete the function.

```
function [pos, val] = FindLargestDiag (M)

% Inputs: M is a square matrix, i.e. the
%           number of rows is equal to the number of columns
% Outputs: pos is the position of the largest
%           value in the diagonal of M, and val is the
%           value found at pos
```

Exercise 4:

What is displayed by the following Matlab code:

```
counter = 0;
total = 0;
a = 0;
for i = 1:3:20
    total = total + i;
    counter = counter + 1;
    if rem(i,2) & i>a
        a = i;
    end
end
fprintf('The average is %.2f.\n', total / counter);
fprintf('The other value is %d.\n',a);
```
